

# FAN2103 — TinyBuck™ 3 A, 24 V Input, Integrated Synchronous Buck Regulator

## Features

- 3 A Output Current
- Over 95% Efficiency
- Fully Synchronous Operation with Integrated Schottky Diode on Low-side MOSFET Boosts Efficiency
- Programmable Frequency Operation (200 KHz to 600 KHz)
- Power-good Signal
- Accepts Ceramic Capacitors on Output
- External Compensation for Flexible Design
- Wide Input Range: 3 V to 24 V
- Output Voltage Range: 0.8 V to 90%V<sub>IN</sub>
- Input Under-Voltage Lockout
- Programmable Over-Current Limit
- Under-Voltage, Over-Voltage, and Thermal Protections
- 5x6 mm, 25-pin, 3-Pad MLP

## Applications

- Graphics Cards
- Battery-powered Equipment
- Set-top Boxes
- Point-of-load Regulation
- Servers

## Description

The FAN2103 TinyBuck™ is an easy-to-use, cost- and space-efficient, 3 A synchronous buck solution. It enables designers to solve high current requirements in a small area with minimal external components.

External compensation, programmable switching frequency, and current limit features allow for design optimization and flexibility.

The summing current mode modulator uses lossless current sensing for current feedback and over-current, and includes voltage feedforward.

Fairchild's advanced BiCMOS power process, combined with low R<sub>DS(ON)</sub> internal MOSFETs and a thermally efficient MLP package provide the ability to dissipate high power in a small package.

Output over-voltage, under-voltage, and thermal shutdown protections plus power-good, help protect the devices from damage during fault conditions.

## Pin Configuration

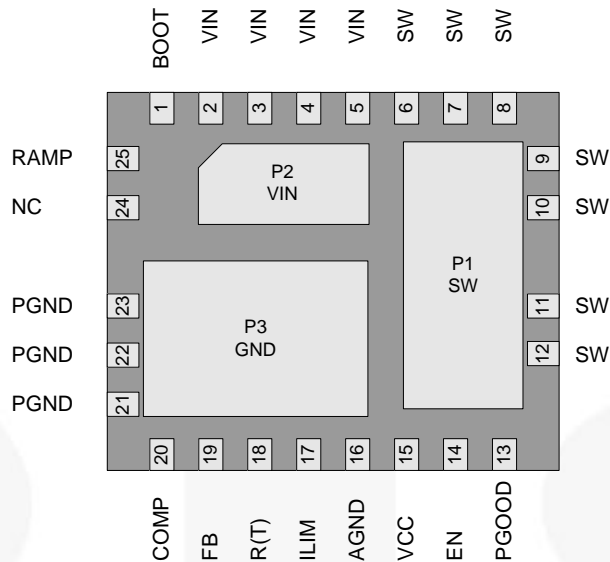

Figure 3. MLP 5 x 6 mm Pin Configuration (Bottom View)

## Pin Definitions

Pin	Name	Description
P1, 6-12	SW	<b>Switching Node.</b>
P2, 2-5	VIN	<b>Power Input Voltage.</b> Connect to the main input power source.
P3, 21-23	PGND	<b>Power Ground.</b> Power return and Q2 source.
1	BOOT	<b>High-side Drive BOOT Voltage.</b> Connect through capacitor ( $C_{BOOT}$ ) to SW. The IC includes an internal synchronous bootstrap diode to recharge the capacitor on this pin to $V_{CC}$ when SW is LOW.
13	PGOOD	<b>Power-Good Flag.</b> An open-drain output that pulls LOW when FB is outside a $\pm 10\%$ range of the reference when EN is HIGH. PGOOD does not assert HIGH until the fault latch is enabled.
14	EN	<b>ENABLE.</b> Enables operation when pulled to logic HIGH or left open. Toggling EN resets the regulator after a latched fault condition. This input has an internal pull-up when the IC is functioning normally. When a latched fault occurs, EN is discharged by a current sink.
15	VCC	<b>Input Bias Supply for IC.</b> The IC's logic and analog circuitry are powered from this pin.
16	AGND	<b>Analog Ground.</b> The signal ground for the IC. All internal control voltages are referred to this pin. Tie this pin to the ground island/plane through the lowest impedance connection.
17	ILIM	<b>Current Limit.</b> A resistor ( $R_{ILIM}$ ) from this pin to AGND can be used to program the current-limit trip threshold lower than the default setting.
18	R(T)	<b>Oscillator Frequency.</b> A resistor ( $R_T$ ) from this pin to AGND sets the PWM switching frequency.
19	FB	<b>Output Voltage Feedback.</b> Connect through a resistor divider to the output voltage.
20	COMP	<b>Compensation.</b> Error amplifier output. Connect the external compensation network between this pin and FB.
24	NC	<b>No Connect.</b> This pin is not used.
25	RAMP	<b>Ramp Amplitude.</b> A resistor ( $R_{RAMP}$ ) connected from this pin to VIN sets the ramp amplitude and provides voltage feedforward functionality.

## Absolute Maximum Ratings

Stresses exceeding the absolute maximum ratings may damage the device. The device may not function or be operable above the recommended operating conditions and stressing the parts to these levels is not recommended. In addition, extended exposure to stresses above the recommended operating conditions may affect device reliability. The absolute maximum ratings are stress ratings only.

Parameter	Conditions	Min.	Max.	Unit
VIN to PGND			28	V
VCC to AGND	AGND = PGND		6	V
BOOT to PGND			35	V
BOOT to SW		-0.3	6.0	V
SW to PGND	Transient (t < 20 ns, f < 600 KHz)	-5	30	V
All other pins		-0.3	V <sub>CC</sub> +0.3	V
ESD	Human Body Model, JEDEC JESD22-A114	2.0		kV
	Charged Device Model, JEDEC JESD22-C101	2.5		

## Recommended Operating Conditions

The Recommended Operating Conditions table defines the conditions for actual device operation. Recommended operating conditions are specified to ensure optimal performance to the datasheet specifications. Fairchild does not recommend exceeding them or designing to absolute maximum ratings.

Symbol	Parameter	Conditions	Min.	Typ.	Max.	Unit
V <sub>CC</sub>	Bias Voltage	VCC to AGND	4.5	5.0	5.5	V
V <sub>IN</sub>	Supply Voltage	VIN to PGND	3		24	V
T <sub>A</sub>	Ambient Temperature	FAN2103M	-10		+85	°C
		FAN2103EM	-40		+85	°C
T <sub>J</sub>	Junction Temperature				+125	°C

## Thermal Information

Symbol	Parameter	Min.	Typ.	Max.	Unit
T <sub>STG</sub>	Storage Temperature	-65		+150	°C
T <sub>L</sub>	Lead Soldering Temperature, 10 Seconds			+300	°C
T <sub>VP</sub>	Vapor Phase, 60 Seconds			+215	°C
T <sub>I</sub>	Infrared, 15 Seconds			+220	°C
θ <sub>JC</sub>	Thermal Resistance: Junction-to-Case	P1 (Q2)	4		°C/W
		P2 (Q1)	7		°C/W
		P3	4		°C/W
θ <sub>J-PCB</sub>	Thermal Resistance: Junction-to-Mounting Surface		35 <sup>(1)</sup>		°C/W
P <sub>D</sub>	Power Dissipation, T <sub>A</sub> = 25°C			2.8 <sup>(1)</sup>	W

### Note:

- Typical thermal resistance when mounted on a four-layer, two-ounce PCB, as shown in Figure 26. Actual results are dependent on mounting method and surface related to the design.

## Electrical Specifications

Recommended operating conditions are the result of using the circuit shown in Figure 1 unless otherwise noted.

## Circuit Description

### Initialization

Once  $V_{CC}$  exceeds the UVLO threshold and EN is HIGH, the IC checks for an open or shorted FB pin before releasing the internal soft-start ramp (SS).

If R1 is open (as shown in Figure 1), the error amplifier output (COMP) is forced LOW and no pulses are generated. After the SS ramp times out (T1.0), an under-voltage latched fault occurs.

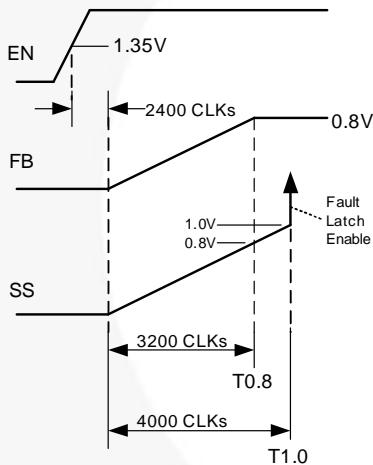

If the parallel combination of R1 and  $R_{BIAS}$  is  $\leq 1K\Omega$ , the internal SS ramp is not released and the regulator does not start.

### Soft-Start

Once internal SS ramp has charged to 0.8 V (T0.8), the output voltage is in regulation. Until SS ramp reaches 1.0 V (T1.0), the "Fault Latch" is inhibited.

To avoid skipping the soft-start cycle, it is necessary to apply  $V_{IN}$  before  $V_{CC}$  reaches its UVLO threshold.

Soft-start time is a function of oscillator frequency.

**Figure 21. Soft-Start Timing Diagram**

The regulator does not allow the low-side MOSFET to operate in full synchronous rectification mode until internal SS ramp reaches 95% of  $V_{REF}$  (~0.76 V). This helps the regulator start against pre-biased outputs (as shown in Figure 16) and ensures that inductor current does not "ratchet" up during the soft-start cycle.

$V_{CC}$  UVLO or toggling the EN pin discharges the SS and resets the IC.

### Bias Supply

The FAN2103 requires a 5 V supply rail to bias the IC and provide gate-drive energy and controller power. Connect a  $\geq 1.0 \mu\text{f}$  X5R or X7R decoupling capacitor between  $V_{CC}$  and PGND. Whenever the EN pin is pulled up to  $V_{CC}$ , the 5 V supply connected to  $V_{CC}$  should be turned ON after  $V_{IN}$  comes up. If the power supply is turned ON using EN pin with an external control after  $V_{CC}$  and  $V_{IN}$  come up, the  $V_{CC}$  and  $V_{IN}$  power sequencing is not relevant.

Since  $V_{CC}$  is used to drive the internal MOSFET gates, supply current is frequency and voltage dependent. Approximate  $V_{CC}$  current ( $I_{CC}$ ) can be calculated using:

$$I_{CC(\text{mA})} = 4.58 + \left[ \left( \frac{V_{CC} - 5}{227} + 0.013 \right) \cdot (f - 128) \right] \quad (1)$$

where frequency (f) is expressed in KHz.

### Setting the Output Voltage

The output voltage of the regulator can be set from 0.8 V to ~80% of  $V_{IN}$  by an external resistor divider (R1 and  $R_{BIAS}$  in Figure 1).

The internal reference is 0.8 V with 650 nA, sourced from the FB pin to ensure that if the pin is open, the regulator does not start.

The external resistor divider is calculated using:

$$\frac{0.8V}{R_{BIAS}} = \frac{V_{OUT} - 0.8V}{R1} + 650\text{nA} \quad (2)$$

Connect  $R_{BIAS}$  between FB and AGND.

### Setting the Frequency

Oscillator frequency is determined by an external resistor,  $R_T$ , connected between the R(T) pin and AGND:

$$f(\text{KHz}) = \frac{10^6}{(65 \cdot R_T) + 135} \quad (3)$$

where  $R_T$  is expressed in  $K\Omega$ .

$$R_{T(K\Omega)} = \frac{(10^6 / f) - 135}{65} \quad (4)$$

where frequency (f) is expressed in KHz.

The regulator does not start if  $R_T$  is left open.

## Calculating the Inductor Value

Typically the inductor is set for a ripple current ( $\Delta I_L$ ) of 10% to 35% of the maximum DC load. Regulators requiring fast transient response use a value on the high side of this range, while regulators that require very low output ripple and/or use high-ESR capacitors restrict allowable ripple current:

$$\Delta I_L = \frac{V_{OUT} \cdot (1 - D)}{L \cdot f} \quad (5)$$

where  $f$  is the oscillator frequency and:

$$L = \frac{V_{OUT} \cdot (1 - D)}{\Delta I_L \cdot f} \quad (6)$$

## Setting the Ramp Resistor Value

The internal ramp voltage excursion ( $\Delta V_{RAMP}$ ) during  $t_{ON}$  should be set to 0.6 V.  $R_{RAMP}$  is approximately:

$$R_{RAMP}(k\Omega) = \frac{(V_{IN} - 1.8) \cdot V_{OUT}}{18 \times 10^{-6} \cdot V_{IN} \cdot f} - 2 \quad (7)$$

where frequency ( $f$ ) is expressed in KHz.

## Setting the Current Limit

The current limit system involves two comparators. The MAX  $I_{LIMIT}$  comparator is used with a  $V_{ILIM}$  fixed-voltage reference and represents the maximum current limit allowable. This reference voltage is temperature compensated to reflect the  $R_{DS(ON)}$  variation of the low-side MOSFET. The ADJUST  $I_{LIMIT}$  comparator is used where the current limit needs to be set lower than the  $V_{ILIM}$  fixed reference. The 10  $\mu A$  current source does not track the  $R_{DS(ON)}$  changes over temperature, so change is added into the equations for calculating the ADJUST  $I_{LIMIT}$  comparator reference voltage, as is shown below. Figure 22 shows a simplified schematic of the over-current system.

**Figure 22. Current-Limit System Schematic**

Since the  $I_{LIM}$  voltage is set by a 10  $\mu A$  current source into the  $R_{ILIM}$  resistor, the basic equation for setting the reference voltage is:

$$V_{RILIM} = 10\mu A \cdot R_{ILIM} \quad (8)$$

To calculate  $R_{ILIM}$ :

$$R_{ILIM} = V_{RILIM} / 10\mu A \quad (9)$$

The voltage  $V_{RILIM}$  is made up of two components,  $V_{BOT}$  (which relates to the current through the low-side MOSFET) and  $V_{RMPEAK}$  (which relates to the peak current through the inductor). Combining those two voltage terms results in:

$$R_{ILIM} = (V_{BOT} + V_{RMPEAK}) / 10\mu A \quad (10)$$

$$R_{ILIM} = \{0.96 + (I_{LOAD} \cdot R_{DS(ON)} \cdot K_T \cdot 8)\} + \{D \cdot (V_{IN} - 1.8) / (f_{SW} \cdot 0.03 \cdot 10^{-3} \cdot R_{RAMP})\} / 10\mu A \quad (11)$$

where:

$$V_{BOT} = 0.96 + (I_{LOAD} \cdot R_{DS(ON)} \cdot K_T \cdot 8);$$

$$V_{RMPEAK} = D \cdot (V_{IN} - 1.8) / (f_{SW} \cdot 0.03 \cdot 10^{-3} \cdot R_{RAMP});$$

$I_{LOAD}$  = the desired maximum load current;

$R_{DS(ON)}$  = the nominal  $R_{DS(ON)}$  of the low-side MOSFET;

$K_T$  = the normalized temperature coefficient for the low-side MOSFET (on datasheet graph);

$D = V_{OUT} / V_{IN}$  duty cycle;

$f_{SW}$  = Clock frequency in kHz; and

$R_{RAMP}$  = chosen ramp resistor value in  $k\Omega$ .

After 16 consecutive, pulse-by-pulse, current-limit cycles, the fault latch is set and the regulator shuts down. Cycling  $V_{CC}$  or EN restores operation after a normal soft-start cycle (refer to the *Auto-Restart section*).

The over-current protection fault latch is active during the soft-start cycle. Use 1% resistor for  $R_{ILIM}$ .

## Loop Compensation

The loop is compensated using a feedback network around the error amplifier. Figure 23 shows a complete Type-3 compensation network. Type-2 compensation eliminates  $R3$  and  $C3$ .

**Figure 23. Compensation Network**

Because the FAN2103 employs summing current-mode architecture, Type-2 compensation can be used for many applications. For applications that require wide loop bandwidth and/or use very low-ESR output capacitors, Type-3 compensation may be required.

$R_{RAMP}$  provides feedforward compensation for changes in  $V_{IN}$ . With a fixed  $R_{RAMP}$  value, the modulator gain increases as  $V_{IN}$  is reduced, which could make it difficult to compensate the loop. For designs with low input voltages (3 V to 6.5 V), it is recommended that a separate  $R_{RAMP}$  and the compensation component values are used as compared to designs with  $V_{IN}$  between 6.5 V and 24 V.

### Protection

The converter output is monitored and protected against extreme overload, short-circuit, over-voltage, and under-voltage conditions.

An internal "Fault Latch" is set for any fault intended to shut down the IC. When the fault latch is set, the IC discharges  $V_{OUT}$  by enhancing the low-side MOSFET until  $FB < 0.25$  V. The MOSFET is not turned on again unless  $FB > 0.5$  V. This behavior discharges the output without causing undershoot (negative output voltage).

Figure 24. Latched Fault Response

### Under-Voltage Shutdown

If FB remains below the under-voltage threshold for 16 consecutive clock cycles, the fault latch is set and the converter shuts down. This fault is prevented from setting the fault latch during soft-start.

### Over-Voltage Protection / Shutdown

If FB exceeds  $115\% \cdot V_{REF}$  for two consecutive clock cycles, the fault latch is set and shutdown occurs.

A shorted high-side MOSFET condition is detected when SW voltage exceeds  $-0.7$  V while the low-side MOSFET is fully enhanced. The fault latch is set immediately upon detection.

The two fault protection circuits above are active all the time, including during soft-start.

### Auto-Restart

After a fault, EN is discharged with  $1 \mu A$  to a 1.1 V threshold before the 800 K $\Omega$  pull-up is restored. A new soft-start cycle begins when EN charges above 1.35 V.

Depending on the external circuit, the FAN2103 can be provisioned to remain latched-off or automatically restart after a fault.

Table 1. Fault / Restart Provisioning

EN pin	Controller / Restart State
Pull to GND	OFF (disabled)
$V_{CC}$	No restart – latched OFF (after $V_{CC}$ comes up)
Open	Immediate restart after fault
Cap to GND	New soft-start cycle after: $t_{DELAY} (ms) = 3.9 \cdot C(nf)$

With EN left open, restart is immediate.

If auto-restart is not desired, tie the EN pin to the  $V_{CC}$  pin or pull it high after  $V_{CC}$  comes up with a logic gate to keep the  $1 \mu A$  current sink from discharging EN to 1.1 V.

Figure 25. Fault Latch with Delayed Auto-Restart

### Over-Temperature Protection

FAN2103 incorporates an over-temperature protection circuit that sets the fault latch when a die temperature of about  $160^{\circ}C$  is reached. The IC is allowed to restart when the die temperature falls below  $130^{\circ}C$ .

### Power Good (PGOOD) Signal

PGOOD is an open-drain output that asserts LOW when  $V_{OUT}$  is out of regulation, as measured at the FB pin (thresholds are specified in the Electrical Specifications section). PGOOD does not assert HIGH until the fault latch is enabled (T1.0).

**DISCLAIMER**

FAIRCHILD SEMICONDUCTOR RESERVES THE RIGHT TO MAKE CHANGES WITHOUT FURTHER NOTICE TO ANY PRODUCTS HEREIN TO IMPROVE RELIABILITY, FUNCTION, OR DESIGN. TO OBTAIN THE LATEST, MOST UP-TO-DATE DATASHEET AND PRODUCT INFORMATION, VISIT OUR WEBSITE AT [HTTP://WWW.FAIRCHILDSEMI.COM](http://www.fairchildsemi.com). FAIRCHILD DOES NOT ASSUME ANY LIABILITY ARISING OUT OF THE APPLICATION OR USE OF ANY PRODUCT OR CIRCUIT DESCRIBED HEREIN; NEITHER DOES IT CONVEY ANY LICENSE UNDER ITS PATENT RIGHTS, NOR THE RIGHTS OF OTHERS. THESE SPECIFICATIONS DO NOT EXPAND THE TERMS OF FAIRCHILD'S WORLDWIDE TERMS AND CONDITIONS, SPECIFICALLY THE WARRANTY THEREIN, WHICH COVERS THESE PRODUCTS.

**AUTHORIZED USE**

Unless otherwise specified in this data sheet, this product is a standard commercial product and is not intended for use in applications that require extraordinary levels of quality and reliability. This product may not be used in the following applications, unless specifically approved in writing by a Fairchild officer: (1) automotive or other transportation, (2) military/aerospace, (3) any safety critical application – including life critical medical equipment – where the failure of the Fairchild product reasonably would be expected to result in personal injury, death or property damage. Customer's use of this product is subject to agreement of this Authorized Use policy. In the event of an unauthorized use of Fairchild's product, Fairchild accepts no liability in the event of product failure. In other respects, this product shall be subject to Fairchild's Worldwide Terms and Conditions of Sale, unless a separate agreement has been signed by both Parties.

**ANTI-COUNTERFEITING POLICY**

Fairchild Semiconductor Corporation's Anti-Counterfeiting Policy. Fairchild's Anti-Counterfeiting Policy is also stated on our external website, [www.fairchildsemi.com](http://www.fairchildsemi.com), under Terms of Use

Counterfeiting of semiconductor parts is a growing problem in the industry. All manufacturers of semiconductor products are experiencing counterfeiting of their parts. Customers who inadvertently purchase counterfeit parts experience many problems such as loss of brand reputation, substandard performance, failed applications, and increased cost of production and manufacturing delays. Fairchild is taking strong measures to protect ourselves and our customers from the proliferation of counterfeit parts. Fairchild strongly encourages customers to purchase Fairchild parts either directly from Fairchild or from Authorized Fairchild Distributors who are listed by country on our web page cited above. Products customers buy either from Fairchild directly or from Authorized Fairchild Distributors are genuine parts, have full traceability, meet Fairchild's quality standards for handling and storage and provide access to Fairchild's full range of up-to-date technical and product information. Fairchild and our Authorized Distributors will stand behind all warranties and will appropriately address any warranty issues that may arise. Fairchild will not provide any warranty coverage or other assistance for parts bought from Unauthorized Sources. Fairchild is committed to combat this global problem and encourage our customers to do their part in stopping this practice by buying direct or from authorized distributors.

**PRODUCT STATUS DEFINITIONS**

**Definition of Terms**

Datasheet Identification	Product Status	Definition
Advance Information	Formative / In Design	Datasheet contains the design specifications for product development. Specifications may change in any manner without notice.
Preliminary	First Production	Datasheet contains preliminary data; supplementary data will be published at a later date. Fairchild Semiconductor reserves the right to make changes at any time without notice to improve design.
No Identification Needed	Full Production	Datasheet contains final specifications. Fairchild Semiconductor reserves the right to make changes at any time without notice to improve the design.
Obsolete	Not In Production	Datasheet contains specifications on a product that is discontinued by Fairchild Semiconductor. The datasheet is for reference information only.
