

1 Form A SOP Solid-State Relay

RoHS
COMPLIANT

FEATURES

- High-speed operation
- Isolation test voltage 2500 V_{RMS}
- Current-limit protection
- High surge capability
- Clean, bounce-free switching
- Extremely low power consumption
- High-reliability monolithic detector
- Surface-mountable
- Compliant to RoHS Directive 2002/95/EC and in accordance to WEEE 2002/96/EC

APPLICATIONS

- PCMCIA type 2 cards
- Battery powered switch applications
- General telecom switching
 - On/off hook
 - Ring relay
 - Ground start
- Programmable controllers
- Instrumentation

DESCRIPTION

The LH1540 relay is an SPST normally open switch (1 form A) in small-outline packages (SOP). It requires a minimal amount of LED drive current to operate, making them ideal for battery powered and power consumption sensitive applications.

The relays are constructed using a GaAlAs LED for actuation control and an integrated monolithic die for the switch output. The die, fabricated in a high-voltage dielectrically isolated BCDMOS technology, is comprised of a photodiode array, switch-control circuitry, and MOSFET switches. In addition, the relays employ current-limiting circuitry enabling it to pass lightning surge testing as per ANSI/TIA-968-B and other regulatory surge requirements when overvoltage protection is provided.

Note

- Stresses in excess of the absolute Maximum Ratings can cause permanent damage to the device. Functional operation of the device is not implied at these or any other conditions in excess of those given in the operational sections of this document. Exposure to absolute Maximum Ratings for extended periods of time can adversely affect reliability.

FUNCTIONAL DESCRIPTION

Figure 1 shows the switch characteristics of the relays. The relay exhibits an on-resistance that is exceptionally linear through the origin and up to the knee current (I_K). Beyond I_K , the incremental resistance decreases, minimizing internal power dissipation. Overload currents are clamped at I_{LMT} by the internal current-limit circuitry. The current-limiting circuitry exhibits a negative temperature coefficient, thereby reducing the current-limit value when relay temperature is increased. An extended clamp condition, which increases relay temperature, decreases the current-limit value, resulting in a current fold back characteristic. When the overload is removed, the relay resumes its normal on-resistance characteristic.

Fig. 1 - Typical AC/DC on Characteristics

In a 1 form A relay, to turn the relay on, forward current is applied to the LED. The amount of current applied determines the amount of light produced for the photodiode array. This photodiode array develops a drive voltage for the MOSFET switch outputs. For high temperature or high-load current operations, more LED current is required.
